

Tutty More Market Garden, West Bagborough
QH1008: 13/12/2021 – 31/03/2022; £2,873.00
QH2020: 01/08/2022 – 31/03/2023; £3,457.00

Hugo van Dorssen runs Tutty More Market Garden (previously Bagborough Market Garden) as a small-scale fruit and vegetable producer. He sells direct to consumer through a stand and food truck and also supplies local chefs and restaurants. He farms according to agroecological, organic and biodynamic principles, minimising soil disturbance, and using compost, wood chip mulching, beneficial soil inoculants and compost teas, and leaving roots in the soil.

Hugo was initially looking for sustainable solutions to wind pressure and crop pests, as well as to maximise productivity within the growing space, and enhance the site's value to wildlife. He applied to FiPL for 180m of hedgerow planting, 24 fruit trees and 50m of fencing, and was awarded £2,873 in FiPL funding for this work. Hugo had previously been monitoring crop loss due to wind pressure, and the project will continue collecting this data, to share with the AONB, as well as other growers looking for nature-based solutions to the challenges of vegetable production.

Tutty More Market Garden has since made a second FiPL application, to expand their operation into the larger field through an agroforestry project. Hugo had previously used chickens to weed and fertilise empty beds, and the field surrounding the growing areas is grazed by a small flock of sheep. Hugo's customers had expressed a demand for more fruit, and the village of West Bagborough once featured dozens of small orchards, which can be seen on tithe maps produced around 1840. Hugo therefore proposed to plant rows of fruit and nut trees and graze the pasture underneath on a rotation of sheep followed by chickens, with long rest periods.

Hugo therefore applied for electric fencing equipment, and 38 trees with post-and-rail guards, and was awarded a further £3,457. He chose a diverse selection of productive trees to expand the offer to his customers, and varied wildlife interest. He will be planting apple, pear, peach, cherry, damson and cobnut.

Short duration, high density and mixed species grazing has been shown to increase carbon sequestration in grassland soils, as well as promote floral diversity and improve resilience to both flood and drought. He will be monitoring the soil organic matter as part of this project, as well as sward density and diversity. The area of the entire site is just 1.3ha. Tutty More Market Garden is demonstrating the potential of small operations to deliver diverse public benefits, including nutrient-dense, sustainable food, community engagement in food production and land management, and nature-friendly farming practices.
